
Getting Started with the SharinPix Free Components

SharinPix is happy to come to you with 3 FREE components dedicated to Images Management in Salesforce. Feel free to use them to enhance your Lightning Apps and Lightning Pages.

It's important to understand what each Component is offering :

Upload Files

This component comes as a button which permits to select multiple files. Those files will be uploaded in background as Attachments.

This component is used by Images Component to upload images but you can use it also to upload files up to 25MB.

Read more about [Upload Files Component](#)

Images

This component permits to upload, display, slide multiple images. It use Files Uploader to store files in object Attachment. It renders automatically files that are already stored as Attachment in the object.

Read more about [Images Component](#)

Image

This component permits to Display a static image. The image have to be uploaded as an attachment. The AttachmentID of this image is to be used in the AttachmentId Parameters of Image component to make it render the image.

Read more about [Image Component](#)

Get ready for more components, we will give you more and more opportunity to enhance your Lightning Experience from our knowledge around images and we will share our basic components so you could focus on the more interesting part of your Apps!

So if you need something else than what we already provided, just ask!

We know that this first version is not perfect, it may come with some bugs that we will try to correct as soon as possible, but we were too impatient to share this with you and make it even better from your feedbacks. Get more about [limitations and known bugs](#)

Upload Files

The Upload File Button

App Builder Usage

If you want to use this component in the App Builder, you have to set the “RecordId” parameters to the ID of the record that will be used for storage.

Everything else will be the same than what it’s described in the [General Usage](#)

Page Builder Usage

If you want to use this component in the Page Builder, you don’t have to set the “RecordId” parameters. An empty parameter will make the component use by default the current record storage.

Custom Lightning Component Usage

The component can be integrated in a Lightning component via code. The API name of the component is Uploader and the namespace is sharinpix_free. The parameters to be passed are:

Parameter	Description	Default value
recordId	Enter the record id	The record ID to which the album corresponds to
label	The upload button label	Upload
filenamePrefix	Add an optional prefix to the component and to the images uploaded through it	sharinpix

multiple	If set to true, this allows multiple image upload via the component	true
uploadChoice	Choose how to save the uploaded images, using either “Attachment” or “ContentDocument”	ContentDocument

Example code:

```
<aura:component access="GLOBAL">
    <sharinpix_free:Uploader recordId="0010Y00000DW2AzQAL" label="Upload" filenamePrefix="abc"
multiple="true" uploadChoice="Attachment"/>
</aura:component>
```

General Usage

This Button component permits multiple files selection to be uploaded as Attachments in the associated object (check App Builder Usage and Page Builder Usage to know how to associate an object to the component).

By default the filter is Images, but the user can change the default filter and upload other type of files within the Operating System Dialog Box.

Once choose, the button is filling himself with green showing the upload progress and will do the upload in background for you. When the upload is achieved, the button shape come back to it's “grey” normal face”.

Parameters

RecordId	
label	
Upload	
Filename prefix	
sharinpix	
☐ Multiple upload	

Record Id : ID of the record that will be used for storage, Default value is Empty. When this parameter is empty the component will use by default the current record storage.

label : Unused for now, will be used in the next version to replace the Upload icon button with the given label.

Filename prefix: A prefix to be added to the images being uploaded by the component.

Multiple upload: When checked, it allows multiple upload of images else only a single image can be uploaded.

Limits

This version is limited to Attachment storage. This storage is compatible between Lightning Experience and Salesforce Classic.

Due to a heap size limitation on the current API used for this implementation the file size is limited to 2,5MB. You can enhance this by using our new implementation based on File API (check Note below for more details).

There is no limitations on the number of files to be uploaded.

Storage warning :

This is using Salesforce storage and a massive usage of this could make you hit Salesforce Quota Limits. Read more about it there :

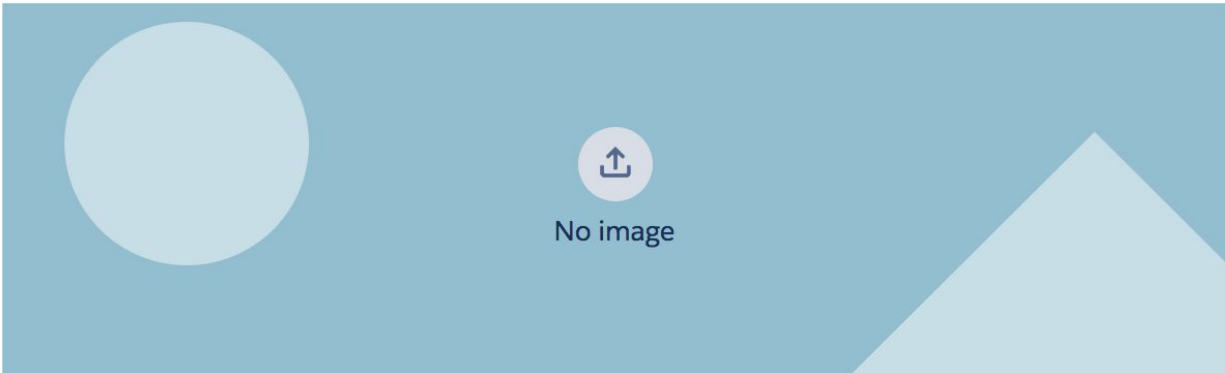

https://help.salesforce.com/articleView?id=limits_storage_allocation.htm

Note

Referring to the Limit of heap size of 2,5MB mentioned in the above section, this has been enhanced to 25MB but require that you give access to profile using the component to the following Visualforce page “SharinPixUploadApi”.

Images

The Images Slider with or without uploaded images

App Builder Usage

If you want to use this component in the App Builder, you have to set the “RecordId” parameters to the ID of the record that will be used for storage.

Everything else will be the same than what it’s described in the [General Usage](#)

Page Builder Usage

If you want to use this component in the Page Builder, you don't have to set the “RecordId” parameter. An empty parameters will make the component use by default the current object storage.

Custom Lightning Component Usage

The component can be integrated in a Lightning component via code. The API name of the component is Image and the namespace is sharinpix_free. The parameters to be passed are:

Parameter	Description	Default value
recordId	Enter the record id	The record ID to which the album corresponds to
height	Height of the container	-
interval	Interval (in milliseconds) between image change	0 (no change)
prefix	Add an optional prefix to the component and to the images uploaded through it	-
multiple	If set to true, this allows multiple image upload via the component	true
uploadChoice	Choose how to save the uploaded images, using either “Attachment” or “ContentDocument”	ContentDocument

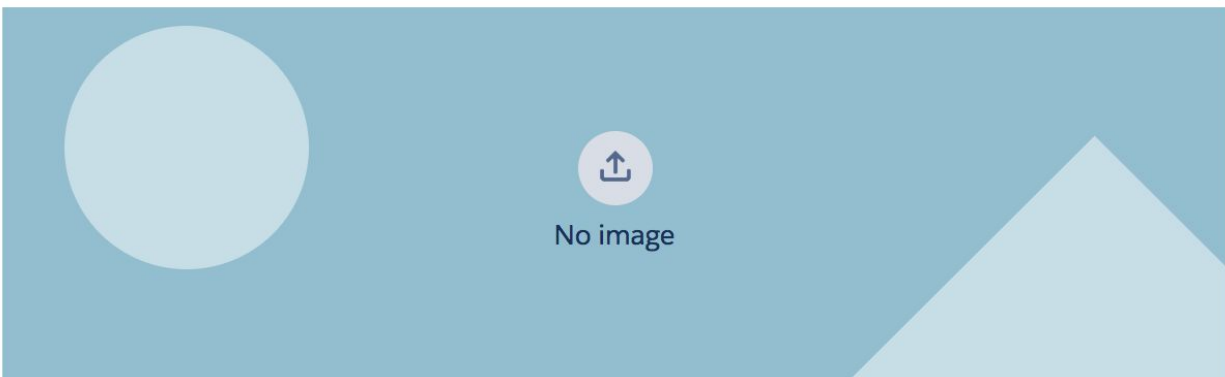

Example code:

```
<aura:component access="GLOBAL">
    <sharinpix_free:Image recordId="0010Y00000DW2AzQAL" height="300" interval="5000"
multiple="true" uploadChoice="Attachment"/>
</aura:component>
```

General Usage

This Images component permits to upload, show, manage multiple images from an associated object. All the images displayed comes from the Attachments in the associated object (check [App Builder Usage](#) and [Page Builder Usage](#) to know how to associate a specific record to the component).

At first, if no images are available in the Attachments list, the Component don't show any images but just the Files upload button.

Empty Images Component before upload

To learn more about the Upload Files button behavior, please read this : [Upload Files Component](#).

Using the upload command will instantaneously show the uploaded images using URLs get from the Salesforce Attachments. The image is resized to fit in the given width from the Page Builder layout and to a maximum Height corresponding to the Height parameter.

The user can then move from one image to the other using the side arrows.

When clicking on the middle of the image extra buttons will appear to let the user :

-  Upload more images, with the same behavior than the initial upload
-  Delete current displayed image (WARNING this will delete the Attachment directly using the same way you could do with Delete command in the Notes and Attachment list view)

Parameters

Record Id
i

Height
i

Interval
i

Prefix
i

☒ Multiple upload
i

Record Id : ID of the record that will be used for storage, Default value is Empty. When this parameter is empty the component will use by default the current record storage.

Height : Set the maximum Height of images. If not set, there is no maximum height.

Interval: Set the interval of the slider (value given must be in milliseconds)

Prefix: Will be used to isolate upload images to this component only and not retrieve all images found.

Multiple upload: Allowing multiple upload of images. If unchecked, the upload button will allow only single upload and if ever you have images already on the record, you shall not be able to upload more. It will make the component act to have only one image.

Limits

For Upload and storage limits check the details from [Files Upload limits](#).

Viewing Limitations :

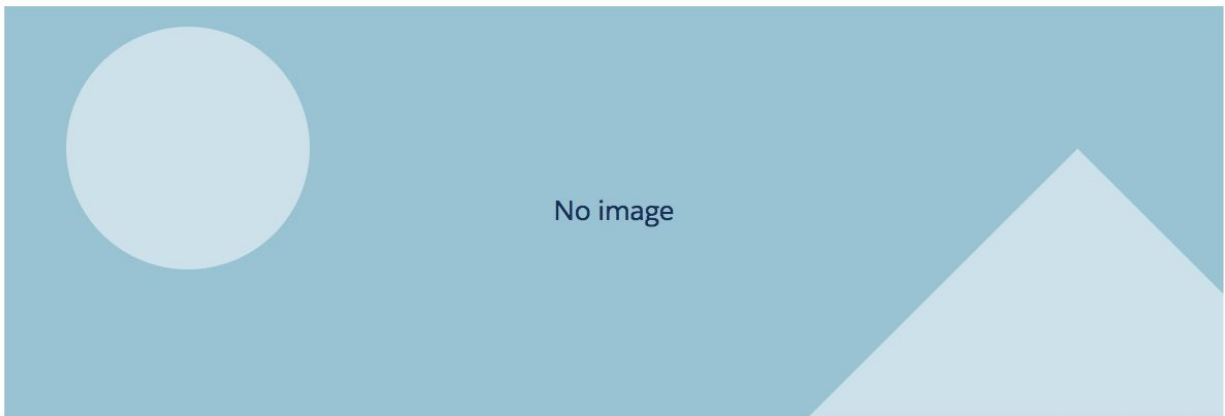

In this version the components display only images store within Attachments from an Upload from the component or from an upload **UNDER SALESFORCE CLASSIC**. When you upload Files from Notes and Attachments from Lightning, the storage use is simply Files. The Images component don't list and show images from Files yet, but will be supporting this storage in the next weeks.

 Viewing warning :

To display images this component use the **FULL IMAGE RESOLUTION link** from Salesforce Attachments. Images are resized through CSS to be displayed in the corresponding Area. Even if shown in a small version the image still have is full weight and the time before displaying can be long depending on your connection quality.

Image

The Single Image without associated Attachment ID

App Builder Usage

This component is not associated to a specific object, so it could be used in the same way within the App Builder than within the Page Builder.

Page Builder Usage

This component is not associated to a specific object, so it could be used in the same way within the App Builder than within the Page Builder.

Custom Lightning Component Usage

The component can be integrated in a Lightning component via code. The API name of the component is SingleImage and the namespace is sharinpix_free. The parameters to be passed are:

Parameter	Description	Default value
attachmentId	Enter an attachmentId, ContentVersionId or an image link	
height	Enter height of the container	
linkText	The link the text points to	
text	Text to display on image	
verticalAlign	Vertical alignment position of the text. Available options: top, middle, bottom	middle
textSize	Size of the text. Available sizes: small, medium, large	medium
color	Color of the text. Available colors: red, blue, yellow, green, white, black	red

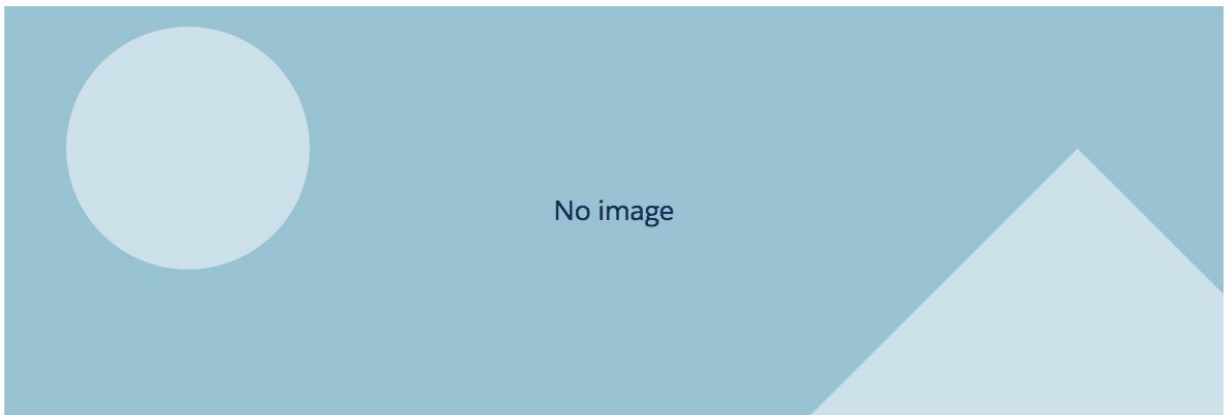

Example code:

```
<aura:component access="GLOBAL">
    <sharinpix_free:SingleImage attachmentId="0010Y00000DW2AzQAL" height="300"
    linkText="https://www.sharinpix.com" text="SharinPix" verticalAlign="bottom" color="blue" />
</aura:component>
```

General Usage

This Image component permits to display a static single image. This image needs to have been stored in Salesforce Attachments.

If no image are associated to this component the display will be the following :

Parameters

Source	
Height	
Link	
Text	
Vertical align	
middle 	
Text size	
medium 	
Color	
red 	

Source : Here you can provide an Attachment ID, a Content Version ID or a link of an image
To learn more about how to get the Attachments ID follow those steps :
Open the Attachment under Salesforce Classic and Click “View”
In the Attachment URL the AttachmentID is the part after “file=” as selected in the following example:

↑ PICTURES NEEDED ↑

Upload at least 3 photos of this kind

The same applies for a content version.

Height : Set the maximum Height of images. If not set, there is no maximum height.

Link: A clickable link to be displayed on the Image component.

Text: A text to be displayed on the Image component. If a Link is not empty, then the text will be clickable and redirect to the link.

Vertical align: vertical position of the text on the Image component.

Text size: Size of the text on the Image component.

Color: Color of the text on the Image component.

Q&A

I don't see the Components in the Page Details Layout

Lightning components are not available in Page Details Layout but only in Page Builder and App Builder. Learn more about Lightning components on trailhead here :

https://trailhead.salesforce.com/modules/lex_dev_lc_basics

I don't see the Components in the Page/App Builder

The first step needed to have access to custom Lightning Components is to enable My Domain to your org first :

https://releasenotes.docs.salesforce.com/en-us/winter16/release-notes/rn_lightning_cruc.htm

You can learn more about this also on Trailhead :

<https://trailhead.salesforce.com/projects/quickstart-lightning-components/steps/quickstart-lightning-components1>
