

# SharinPix - Tag Action

Tag Action is a feature in SharinPix which provides field update when a tag is applied on an image. It supports both Standard and Custom objects. Available in both Salesforce Classic and Lightning.

This could be setup through the SharinPix admin Panel in the Tags Tab ( you can access the admin Panel from SharinPix Settings tab within Salesforce).

## Configuring tag to add one or more actions

1. Create a new tag or edit an existing one.
2. In the section Actions
  - a. Insert the salesforce api name of the field you want to update
  - b. Select between a predefined value or a custom one
  - c. Optional: Click on button Add Row if you want more than one action on the specified tag

Here is the list of available values:

| Name          | Description                                                               |
|---------------|---------------------------------------------------------------------------|
| Width         | The original width of the image                                           |
| Height        | The original height of the image                                          |
| Full url      | The url of the image with maximum width and height of 1920px              |
| Large url     | The url of the image with maximum width and height of 200px               |
| Mini url      | The url of the image with maximum width and height of 100px               |
| Original url  | The url of the original image                                             |
| Id            | The SharinPix Id of the image as stored in SharinPix database             |
| Geolocation   | Geolocation value found in the image metadata                             |
| Fit to size   | A URL to the image fitted to the specified size *                         |
| Fill to size  | A URL to the image filled to the specified size *                         |
| Scale to size | A URL to the image scaled to the specified size *                         |
| Pad to size   | A URL to the image padded to the specified size *                         |
| Custom value  | Add a custom value to the field (can be a text, true or false, a numeric) |

\* The original image is not affected. The size can be specified by using <width>x<height> or <width and height>. Examples are:

- "500x500" for a width and height of 500px. This can also be written as just "500"
- "600x400" for a width of 600px and height of 400px
- "750" for a width and height of both 750px

The difference between fit, fill scale and pad is as follows.

Fit: The image is resized so that it takes up as much space as possible within a bounding box defined by the given width and height parameters. The original aspect ratio is retained and all of the original image is visible.

Fill: An image is created with the exact given width and height while retaining the original aspect ratio, using only part of the image that fills the given dimensions if necessary (only part of the original image might be visible if the requested aspect ratio is different from the original aspect ratio).

Scale: Changes the size of the image exactly to the given width and height without necessarily retaining the original aspect ratio: all original image parts are visible but might be stretched or shrunk.

Pad: Resizes the image to fill the given width and height while retaining the original aspect ratio and with all of the original image visible. If the proportions of the original image do not match the given width and height, padding is added to the image to reach the required size.

## Visualforce

To activate it on your visualforce page with SharinPix integration. Just add the following code in the visualforce page.

```
<apex:page standardController="Contact" extensions="SharinPixDemoAction">
<!-- add the line below to your visualforce page -->
    <sharinpix:TagAction recordId="{!$CurrentPage.Parameters.Id}" />
    <apex:canvasApp developerName="Albums" height="500px" parameters="{!parameters}"
width="100%"/>
</apex:page>
```

The above code contains a custom controller for generating the “parameters” variable. If you are in a professional environment and don’t have access to apex classes or if your parameters will be static and won’t require any additional logic in it, then the following example suits you best.

## Lightning

Drag and drop the SharinPix Lightning component from the App builder and place it on the lightning page.

From the Component properties menu, click on the checkbox “Enable Action”.

Save the page and you are done.

The screenshot displays the Lightning App Builder interface for a contact record page. The main content area shows a contact profile for "Mr. Avi Green" with fields for Title (CFO), Account Name (United Oil & Gas Corp.), Phone (212) 842-5500, Email (agreen@uog.com), and Contact Owner (Luc De...).

Below the contact information, there are sections for "RELATED" and "DETAILS". The "RELATED" section includes a "News" feed with articles about energy industry news, a "Learn More Using Twitter" section, and "Opportunities (0)". The "DETAILS" section shows "Cases (1)" with a subject "Performance inadequate for second cons...".

On the right side, the "Page > SharinPix" configuration panel is visible. It includes fields for "AlbumId" and "Height" (set to 500). A checkbox labeled "Enable action" is checked, and a tooltip points to it with the text "Click here to enable the tag action".

The left sidebar shows the "Lightning Components" menu with various components like Chatter Publisher, Filter List, Flow (Beta), Highlights Panel, News, Recent Items, Record Detail, Related Lists, Report Chart, Rich Text, Tabs, Twitter, and Visualforce. Under "Custom (2)", there are components for RFPD\_OPAMainContent and RFPD\_VisitPlanningOPAComp. Under "Custom - Managed (4)", there are components for Image, Images, SharinPix, and Upload Files.
